Visual Job Ticketing using a Document Viewing Application

Abstract of Disclosure

A standard document viewing application, such as Adobe Acrobat Exchange, Microsoft Word or others, is used with plug in enhancements to display a document to be printed and visual feedback cues associated with user selected print job parameters. The job originator then has all the advantages of the viewing application when ticketing the job, such as thumbnail drag-and-drop and other manipulations, zoom, multiple-page display, multiple documents open simultaneously, document content editing and adjustment, bookmarks and other document navigation aids. In addition, the job originator can use a familiar interface to view documents without having to learn a new application.
